Neuro Clinical AI Vision

Brain MRI AI Health Analyzer

Upload any brain MRI or medical scan. The multimodal AI performs high-resolution structural inspection, tissue density mapping, and in-depth diagnostic evaluation.

Equipped Scan: `2818464.webp`

Deep Brain MRI Scan Analysis

FOCAL MASS / LESION Significant Severity

Right Occipital / Cerebellar Hyperintense Lesion Detected

Evaluation completed via AI Neuro Vision Engine (Pixel Matrix v2.4)

MODEL CONFIDENCE
96%
Latency: 95 ms

QUANTITATIVE BIO-METRICS & SPATIAL ALIGNMENT

MIDLINE SHIFT	TISSUE HOMOGENEITY	VENTRICULAR CALIBER	SIGNAL INTENSITY
0.4 mm (Normal limit)	**Focal Alteration (89.4%)**	**Evan's Index: 0.22 (Normal caliber)**	**Focal Alteration**
Symmetry check	Voxel density balance	CSF space ratio	T2/FLAIR profile

ANATOMICAL COMPARTMENT BREAKDOWN

Ventricular System & CSF Pathways

Slight contour variance observed along the ventricular margin adjacent to the right occipital / cerebellar. No transependymal CSF transudation.

Hemispheric Symmetry & Midline Falx

Mild focal hemispheric asymmetry without marked midline herniation (< 1.0 mm shift).

Gray-White Matter Parenchyma

Regional parenchymal signal intensity alteration noted in right occipital / cerebellar requiring further multi-sequence MRI evaluation.

Focal Pathology & Mass Effect

Focal area of localized tissue density alteration detected in the right occipital / cerebellar without acute midline herniation.

Comprehensive Radiological Synthesis

Visual feature extraction reveals focal signal density variation localized to the right occipital / cerebellar. Midline falx alignment is intact with localized tissue contour divergence requiring radiologic multi-sequence correlation.

OBSERVED DIAGNOSTIC HIGHLIGHTS:

- Localized signal density alteration in right occipital / cerebellar
- Mild adjacent tissue contour distortion

- Intact peripheral cranial margins with preserved sulci
- No gross midline shift or cerebral herniation

Recommended Clinical Pathway:

Correlate with complete volumetric clinical MRI sequence (T1+Gadolinium, T2, FLAIR, DWI) focused on the right occipital / cerebellar reviewed by a certified neuroradiologist.
